AI Engineering Bootcamp

Capstone Submission & Evaluation Guide

Capstone Assignment Options

You have been provided with **4 assignment briefs**:

- Coding Platform (CodePilot)
- Multi-Agent Document Intake System
- Text-to-SQL Analytics Engine
- AI-Powered HR Operations Copilot

How to Choose

- You can **pick any ONE assignment** and complete it
- Or you can choose to **work on more than one** (optional, not required).

What matters more than quantity is:

- Depth of implementation
- System design clarity
- Correctness and safety

Objective

The capstone is not just a completion requirement; it is your opportunity to demonstrate **production-grade AI engineering skills across system design, safety, and full-stack integration**.

Deadline

21st October 2026 (11:59 PM IST)

What You Must Submit

1. Code Repository (GitHub)

- Complete working implementation
- Clean project structure
- No secrets or API keys committed

2. Documentation

- Architecture overview
- Setup instructions
- Key design decisions
- Known limitations

3. Demo Video (5–10 mins)

- Walkthrough of your system
- Showcase all core features
- Include at least one complete end-to-end flow

4. Evaluation Readiness

Your system should be testable using:

- Policy questions
- SQL queries
- HR actions
- Security edge cases

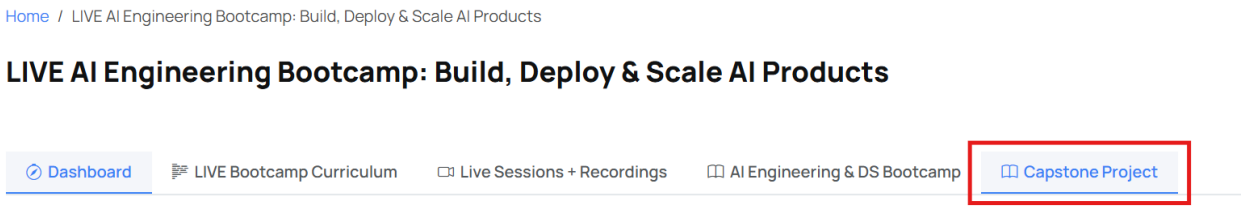

Evaluation Criteria

Weightage	Component
20%	Overall Participation throughout the bootcamp
40%	Implementation, Architecture & Engineering
30%	Presentation & Demo
10%	Documentation & Deployment

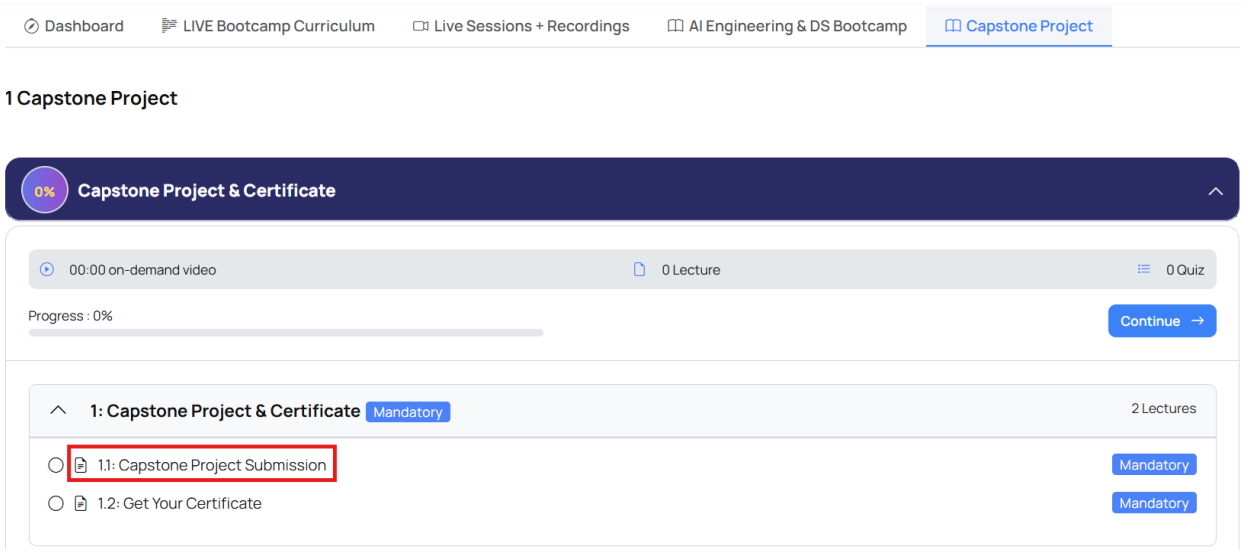

How to Submit

Follow these steps to submit your assignment:

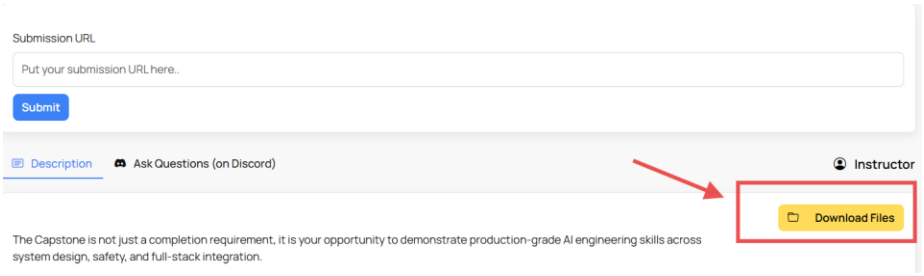

1. Go to the “Capstone Project” tab in LMS.

2. Go to the “Capstone Project Submission Module”.

3. Click On “Download Files” to get all the instructions and project related files.

4. After the completion of the project, Submit the **LinkedIn Post Link (Containing GitHub Repo Link) or GitHub repository link** in the given box.

5. Once the assignment is approved, you can generate and download your certificate, going to the next chapter “Get Your Certificate” and clicking on “Complete and Get Certificate”.

Submission Requirements (Important)

- Your GitHub repo must be **public and accessible**.
- The repo should contain **complete working code + documentation**.
- In your **README.md**, you must include:
    - A **demo video link** (Drive / YouTube / Loom/LinkedIn)
    - Setup instructions
    - Brief explanation of your approach

Submissions without a working repo or demo video link may not be evaluated.

What Actually Matters in Evaluation

Beyond the scoring table, evaluation is based on:

- **Correctness** → Does the system work reliably?
- **Safety** → Are guardrails and permissions properly enforced?
- **System Thinking** → Is this built like a real product, not just a demo?
- **Clarity** → Can you clearly explain your decisions and trade-offs

Rewards & Recognition

Top-performing submissions will:

- Be eligible for a **surprise**
- Be **highlighted across the cohort**
- Be selected as **reference projects for future batches**

Final Note

Building something that:

- works under real conditions,
- respects constraints,
- and reflects strong engineering judgment

-> that is what will set your submission apart.

All the best
